The Creation Ct630/CT1200 is a USB-based cutter. There are two operating modes: USB and serial. By default, it uses the serial connection. However, you can set the device to use the USB connection when you plug it into your computer. When you plug it into the computer, the device will not respond on the serial port. You will need to setup and use the driver listed below to use the cutter on your computer. In order to use the cutter, you need to install a driver and configure the cutter settings. Here is a tutorial on setting up a vinyl cutter using a USB cable. Follow the steps to set up the cutter using a USB cable. If you have any questions, please let me know in the comments below. Thats why we need to include malloc and free functions everywhere in the program. But how to allocate memory inside function like in case of recursion, I am not able to get my head around how to allocate memory from inside function? How does the malloc function will take care of the memory allocation? My question is different from Questions about optimizing memory allocation because my question is not about optimizing memory allocation. Instead, I am looking for some details about how to allocate memory inside the function? Note: I am using programming language - C. A: How does the malloc function will take care of the memory allocation? In both cases: The C standard mandates malloc() to allocate (heap) memory by invoking the OS memory manager, unless this is not possible, e.g. due to a size limit. how to allocate memory inside the function Allocation is not possible inside the function, the function does not get any memory to work with. It is however usually a good idea to provide a function argument and then invoke it within the function. For example, consider something like: f988f36e3a
