Q: When to use RequireJS optimize: none and why? I'm using webpack to bundle up a few small files and one of them is jQuery. Using RequireJS to load it I do this in my HTML: `requirejs(['jquery'], function ($) { alert($); });` When I run webpack, it complains about jquery not being found because it's not optimized yet. I added to my webpack config: `optimize: 'none'` But the same thing happens. So my question is what is the reason to use `optimize: none` and when it's recommended to use it?

A: You use it to skip the optimization for jQuery, or any other library that you'd like to load when the user requests the web page (hence no optimizing for them). You can also skip the optimization if you have a script in

your html that already defines jQuery or any other library you want. It's been over a decade since the first idea for the Shadowrun franchise came into play.
